

EXPERIMENT – 7

SERIAL COMMUNICATION USING ARDUINO WITH PROTEUS

AIM: To write an Embedded C program for serial communication using Arduino Uno and Proteus.

OBJECTIVES:

1. To initialize serial communication at 9600 baud rate.
2. To transmit numerical data through the Arduino serial port.
3. To observe the transmitted data in Proteus serial terminal.

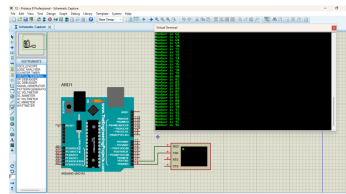

PROGRAM:

```
void setup()
{
    Serial.begin(9600); // send and receive at 9600 baud
}
int number = 0;
void loop()
{
    Serial.print("Number is ");
    Serial.println(number);
    delay(500);
    number++;
}
```

OUTPUT IMAGE:

```
void loop()
{
    Serial.print("Number is ");
    Serial.println(number); // print the number
    delay(500); // delay half second between numbers
    number++; // to the next number
}
```

OUTPUT:

RESULT:

Thus the program has been successfully verified and executed.

RESULT:

Thus the program has been successfully verified and executed.
